Dear Chairwoman Murray and Chairman Ryan:

The undersigned organizations and institutions, which represent patients, scientists, health care providers, universities, and industry, are gravely concerned about the impact of continued cuts, including sequestration, on medical research supported by the National Institutes of Health (NIH), and the subsequent negative consequences for the health of all Americans. We respectfully urge Congress and the Administration to work together on a responsible FY 2014 budget agreement that replaces sequestration with a balanced plan that recognizes the significant cuts already made to discretionary programs, preserves the nation's investment in medical research, and protects the health of the American people.

NIH Director Francis Collins, M.D., Ph.D., has said the nation is on the cusp of benefiting from “unprecedented scientific opportunity,” and that “we’ve never had a better chance to make rapid progress in preventing, diagnosing, and curing human disease.” However, instead of investing more in medical research, our nation’s commitment to medical research has continued to shrink to a point where we are sacrificing real opportunities for discovery of new innovations and medical advances.

Sequestration resulted in a $1.5 billion reduction in funding for NIH in FY 2013. As a result, NIH estimates that it funded 650 fewer competitive research project grants, resulting in a historically low success rate of 17 percent. Dr. Collins has summed up the repercussions of those numbers by saying, “I can’t say which of those grants would have led to the next breakthrough, or which investigator would be a Nobel Prize winner 20 years from now.” Moreover, sequestration’s cuts are following a decade where NIH has lost nearly one-fifth of its purchasing power after inflation, further threatening our nation’s position as the world leader in research and discovery.

In an interview in The Washington Post, Dr. Collins said that the budget cuts are delaying innovation and resulting in more American lives being lost. “When you’re talking about developing cures, speed matters,” he said. Among the critical projects that have lost resources is the effort to develop a universal flu vaccine that scientists hope might prevent pandemics.

As another example, the Framingham Heart Study, which for more than 60 years has produced a wellspring of information that has led to the identification of the major risk factors of cardiovascular disease and dramatic reductions in the death rates for heart disease and stroke, will lose $4 million, or 40 percent, of its funding. This cut will result in the loss of clinical and
administrative staff, reductions in clinic exams and lab operations, and a considerable scale-back of the scope of research, all of which will diminish the ability to identify new risk factors such as genetic factors, for cardiovascular disease.

Cuts in NIH funding also are negatively affecting the next generation of scientists. In a recent survey conducted by the Association of American Medical Colleges, nearly two-thirds of the Ph.D. programs that responded reported that they have decreased or are anticipating decreasing the size of their programs and nearly one in five M.D.-Ph.D. programs indicated a decrease or anticipated decrease in students in the coming year.

If we are to address the health challenges of an aging and increasingly diverse population, and remain a vibrant force in the global economy, America needs more investment in medical research, not less. We respectfully urge Congress and the Administration to work together on a responsible FY 2014 budget that replaces sequestration with a balanced plan that recognizes the significant cuts already made to discretionary programs, preserves the nation's investment in medical research, and protects the health of the American people.

Sincerely,
